In algebra, a quadratic equation (from the Latin quadratus for "square") is any equation that can be rearranged in standard form as $ax^2+bx+c=0$ where x represents an unknown, and a , b , and c represent known numbers, where $a \neq 0$. If $a = 0$, then the equation is linear, not quadratic, as there is no ax^2 term.

In mathematics, G_2 is the name of three simple Lie groups, their Lie algebras \mathfrak{g}_2 , $\{\displaystyle \{\mathfrak{g}\}_2\}$, as well as some algebraic groups. They are the smallest of the five exceptional simple Lie groups. G_2 has rank 2 and dimension 14. It has two fundamental representations, with dimension 7 and 14. The compact form of G_2 can be described as the automorphism group of the octonion algebra or, equivalently, as the subgroup of SO that preserves any chosen particular vector in its 8-d

Algebra. Solve for g $7 = (10 - g) / -2$. Rewrite the equation as $7 \cdot -2 = (10 - g) / -2 \cdot -2$. Multiply both sides of the equation by -2 . Remove parentheses. Multiply by -2 . Move all terms not containing g to the right side of the equation. Tap for more steps... Subtract 14 from both sides of the equation.

This is the second in a series of three volumes dealing with important topics in algebra. Volume 2 is an introduction to linear algebra (including linear algebra over rings), Galois theory, representation theory, and the theory of group extensions. The section on linear algebra (chapters 1–5) does not require any background material from Algebra 1, except an understanding of set theory. Linear algebra is the most applicable

intensive “Russian-style” two-year undergraduate course in abstract algebra, and introduces readers to the basic algebraic structures – fields, rings, modules, algebras, groups, and categories – and explains the main principles of and methods for working with them. The course covers substantial areas of advanced combinatorics, geometry, linear and multilinear algebra, representation theory, category theory, commutative algebra, Galois theory, and algebraic geometry – topics that are often overlooked in standard undergraduate courses. This textbook is based on courses the author

This is the second of three volumes that, together, give an exposition of the mathematics of grades 9–12 that is simultaneously mathematically correct and grade-level appropriate. The volumes are consistent with CCSSM (Common Core State Standards for Mathematics) and aim at presenting the mathematics of K–12 as a totally transparent subject. The first part of this volume is devoted to the study of standard algebra topics: quadratic functions, graphs of equations of degree 2 in two variables, polynomials, exponentials and

logarithms, complex numbers and the fundamental theorem of algebra, and the binomial theorem. Having translations and the concept of similarity at our disposal enables us to clarify the study of quadratic functions by concentrating on their graphs, the same way the study of linear functions is greatly clarified by knowing that their graphs are lines. We also introduce the concept of formal algebra in the study of polynomials with complex coefficients. The last three chapters in this volume complete the systematic exposition of high school geometry that is consistent with CCSSM. These

chapters treat the geometry of the triangle and the circle, ruler and compass constructions, and a general discussion of axiomatic systems, including non-Euclidean geometry and the celebrated work of Hilbert on the foundations. This book should be useful for current and future teachers of K-12 mathematics, as well as for some high school students and for education professionals.
