Advances in the Study of Behavior remains one of the most-turned-to sources for penetrating insight on the latest findings in behavior research. This serial has kept pace with the vigorous multidisciplinary growth of the field and covers all major aspects, from ecology to endocrinology, in both human and animal subjects. Critical reviews, presentations of major research programs, and communication of significant new concepts provide readers with an up-to-date overview of the latest developments in this field. The series does not focus narrowly on one or a few fields, but features articles covering the best behavioral work from a wide spectrum. The skill and concepts of scientists in such diverse fields necessarily differ, making the task of developing cooperation and communication among them a difficult one. But it is one that is of great importance, and one to which the editors and publisher of Advances in the Study of Behavior are committed. Each volume of Advances in the Study of Behavior contains an index, and each chapter includes references.

The book covers the complete field of testis cancer including the germ cell tumors and the stromal tumors, from epidemiology to new chemotherapeutic agents and schedules, throughout genetic features, risk factors, risk adapted treatments, role of different types of surgery and special clinical situations. Special attention is focused on fertility issues, late effects of the primary therapy and the economical aspects of the different treatment policies. As a result of the third Consensus Conference, a consensual follow-up can be devised and a chapter dedicated to this controversial and not yet defined matter. This book is the state-of-the-art reference text on testis cancer and is an essential resource for all urologists, medical oncologists and radio-oncologists.
