have found the approach limiting and frustrating. Why? The employee surveys that companies used to estimate resources required for business activities proved too time-consuming, expensive, and irritating to employees. This book shows you how to implement time-driven activity-based costing (TDABC), an easier and more powerful way to implement ABC. You can now estimate directly the resource demands imposed by each business transaction, product, or customer. The payoff? You spend less time and money obtaining and maintaining TDABC data—and more time addressing problems that TDABC reveals, such as inefficient processes, unprofitable products and customers, and excess capacity. The authors also show how to use TDABC to link strategic planning to operational budgeting, to enhance the due diligence process for mergers and acquisitions, and to support continuous improvement activities such as lean management and benchmarking. In presenting their model, the authors define the two questions required to build TDABC: 1) How much does it cost per time unit to supply resource capacity for each business process? 2) How much resource capacity (time) is required to perform work for a company ' s many transactions, products, and customers? The book demonstrates how to develop simple, valid answers to these two questions. Kaplan and Anderson illustrate the TDABC approach with a wealth of case studies, in diverse settings, based on actual implementations.

This book addresses an important issue -- the nature of and evidence for success in the transfer costing of internal services or shared services or products within a company. The case of activity-based costing (ABC) is used to explore how the proponents have developed a framework linking Quality, Cost and Delivery (QCD) components of products and services. The QCD performance indices, which are the natural properties of products and services, will form part of the Service Level Agreements between the internal service providers (Shared Services Centers) and internal customers (Profit Centers) of the company. This framework optimizes the use of overhead expenses to the end products of the company. This book also discusses the various cost components of the products and services using the full absorption costing principle. It is a revolutionary idea in the sense that all activity costs are considered variable costs and product costs come from activity costs using various cost drivers. The Principal Component Analysis (PCA), the multi-variate statistical tool, is applied using SPSS to analyze which independent variables contribute significantly to the Product Unit Price (PUP) and which should be given more emphasis
