In Fox formula (planning funtion type 0RSPL_FORMULA), there are three functions for variable: VARV, VARC, VARI. Let's use some examples to know how to use it. 1. VARV. Meaning: Get a variable value. Usage example:

~~Three variable functions (VARV, VARC, VARI) in FOX ... - SAP~~

First of all this is an example. There are different ways to get good performance in HANA in combination with PAK. FOX Formulas which are using ABAP fuction modules are not running in memory. The first possibility whould be to change the calls for function modules to "read for reference data" from external aggregation layers.

~~Changing Fox formula to an own planning function ... - SAP~~

Until now we had many options to define planning functions and for the complex ones we could use Formula Extensions - shortly FOX - or ABAP. Starting the version SAP Netweaver 7.3 we have another tool in our toolbox, called Inverse Formula that we can define in the Query Designer.
