In order to run JBoss Application Server from the command line, add the jboss-<release>\bin directory to your path, for example: C:\Program Files\JBoss\jboss-<release>\bin. To do this, open the Control Panel from the Start Menu, switch to Classic View if necessary,

# File Type PDF Jboss Application Server

open the System Control Panel applet, select the Advanced Tab, and click on the Environment Variables button.

## JBoss Application Server

Deploying an application in JBoss is simple and easy. You just have to copy the EAR file to the deploy directory in the 'server

# File Type PDF Jboss Application Server

configuration' directory of your choice.  
Here, we will deploy it to the 'default'  
configuration, so we copy the EAR file to  
the JBOSS\_DIST/jboss-  
as/server/default/deploy directory.

## JBoss Application Server

Start your server. There is a bin directory

# File Type PDF Jboss Application Server

within the JBoss Application Server or the JBoss ESB Server (whichever you have chosen to use). Execute the run script (run.sh on Linux/Mac OS X/Unix, run.bat on Windows). Verify the server you have chosen is running by visiting <http://localhost:8080> with your web browser.

The JBoss Application Server ships with three server configurations. You can choose which configuration to start by passing the `-c` parameter to the server startup script. For instance, command `run.sh -c all` would start the server in the all configuration. Each configuration is contained in a directory named `JBOSS_HOME/server/[config`

For many use cases, the centralized

# File Type PDF Jboss Application Server

management capability available via a managed domain is not necessary. For these use cases, a JBoss Application Server 7 instance can be run as a "standalone server". A standalone server instance is an independent process, much like an JBoss Application Server 3, 4, 5, or 6 instance is.
