Discusses how the resistance to patrician power lead to the first imperial dynasty

Villains, not saints, are the usual stuff of legends, establishing themselves permanently in popular lore and imagination. There are fiends whose villainies are so colourful, so sinister that they both repel and fascinate. Agrippina the Younger is one such, having attained a level of power unprecedented for a woman in first century Rome by a combination of sexual exploitation and ruthless murder. She was so powerful that, after her death, no woman within the imperial family dared overtly assume a major role in political affairs for some 150 years. The ancient sources believed Agrippina plotted against her brother, murdered her husband (the emperor) and slept with her son in order to control him. But did she? In this dynamic new biography - the first on Agrippina in English - Professor Barrett uses the latest archaeological, numismatic and historical evidence to provide a close and detailed study of her life and career. He shows how Agrippina's political contribution to her time seems in fact to have been positive, and that when she is judged by her achievements she demands admiration. Revealing the true figure behind the propaganda and the political machinations of which she was capable, he assesses the impact of her marriage to the emperor Claudius, on the country and her family. Finally, he exposes her one real failing - her relationship with her son, the monster of her own making to whom, in horrific and violent circumstances, she would eventually fall victim.

Rather than rescue Nero's reputation, the author of this stunning new portrait of the infamous Roman emperor documents his cruelties in a comprehensive fashion that leaves no room to dispute his venality and barbarism. (Biography)

Though mathematical ideas underpin the study of neural networks, the author presents the fundamentals without the full mathematical apparatus. All aspects of the field are tackled, including artificial neurons as models of their real counterparts; the geometry of network action in pattern space; gradient descent methods, including back-propagation; associative memory and Hopfield nets; and self-organization and feature maps. The traditionally difficult topic of adaptive resonance theory is clarified within a hierarchical description of its operation. The book also includes several real-world examples to provide a concrete focus. This should enhance its appeal to those involved in the design, construction and management of networks in commercial environments and who wish to improve their understanding of network simulator packages. As a comprehensive and highly accessible introduction to one of the most important topics in cognitive and computer science, this volume should interest a wide range of readers, both students and professionals, in cognitive science, psychology, computer science and electrical engineering.

New translations of significant political writings of Seneca, the most important Stoic philosopher.
